Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.

Disclosure; Fig 1; 65pp; English.

This protein sequence is the Rhapanus sativus (radish) mature antifungal protein (Rs-AFP3), which is homologous to proteins AAW19280- AAW19290. Shorter peptides, based on these proteins have been produced (see AAW19291-92, AAW19294-98, AAW19301-304, AAW19330-34 and AAW31765-834). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease

tolerance of crops, either pre or post harvest. When applied to plants they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of expressing the peptide into the soil. (Updated on 25-MAR-2003 to correct PI field.) 88888888

Protecting plants against pathogens by inducing defensin genes - by stimulating ethylene or jasmonate pathways, also new promoter of defensin gene from Arabidopsis.

Disclosure, Fig 1C; 72pp; English

This sequence represents the radish Rs-AFP3 mature protein domain which is used to explain a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensin gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fundi and does not require cytotoxic or potentially harmful chemicals SO CCC CCC X S X X B X X

Antimicrobial composition useful for treating microbial diseases in plants, comprises two antimicrobial agents, which are antifungal protein from Radish and Mirabilis of Impatiens.

Disclosure; Page 26; 29pp; English

The present sequence is an antifungal protein from Radish. This protein is useful for treating microbial diseases in plants and for inhibiting microbial growth in foodstuffs. In addition, the present sequence is useful for producing plants with improved resistance to microbial pathogens. The present protein can be used in conjunction with other antimicrobial proteins from Mirabilis (see AAB49472-B49473), and Impatiens (see AAB49474-B49477) to form an antimicrobial composition

(first entry) 13-DEC-1997 Radish antifungal protein 2 mutant (delQ1,Q5M/P7S/K30G)

Rs-AFP2; radish antifungal protein 2; fungicide; salt tolerance; preservative; transgenic plant; crop protection.

Raphanus; sativus Synthetic.

; 0

Chimeric.

WO9721814-A1

19-JUN-1997.

96WO-GB003065 12-DEC-1996;

RESULT 3 AAB49478

protein

```
AW2371-90) are based on Rs-AFP2 and contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnSMet (see AAM26379), GlyjBArg (AAW26376), Val39Arg (AAW26377) or Gly9Arg plus Val39Arg (AAW26376) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This polypeptide comprises a mutant isoform of radish antifungal protein (ERS-AFP2) (see also AAM19616). Novel potent antifungal proteins (see AAW26371-90) are based on Rs-AFP2 and contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnSMet (see AAW26379) (Gly16Met (AAW26398), Gly9Arg (AAW26378)) vol199Arg (AAW26378) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New active mutants of radish antifungal protein 2 - used to gener
fungus-resistant plants or as therapeutic or preservative agents.
                                                this polypeptide comprises a mutant isoform of radish antifungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rs-AFP2; radish antifungal protein 2; fungicide; salt tolerance; preservative; transgenic plant; crop protection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Radish antifungal protein 2 mutant (delQ1,Q5E/P7S/G9R/K30G).
                                                                                                                                                                                                                                                                                                                                                                                                         1 KLCERSSGTWSGVCGNNNACKNQCIRLEGAQHGSCNYVFPAHKCICYFPC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                               This polypeptide comprises a mutant isoform of radish antifungal protein 2 (Rs-AFP2) (see also AAM19616). Novel potent antifungal proteins (see AAM2631-90) are based on Rs-AFP2 and contain at least I mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnsMet (see AAW26379), Gly9Arg (AAW26380), Gly9Arg (AAW26380), Gly9Arg (AAW26380), Mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combaring fungal diseases in agricultural, pharmaceutical or preservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rs-APP2, radish antifungal protein 2, fungicide; salt tolerance; (RT) preservative; transgenic plant; crop protection.

Radish antifungal protein 2 mutant (delQ1,Q5E/P7S/G16M/K30G)

Rs-AFP2; radish antifungal protein 2; fungicide; salt tolerance; preservative; transgenic plant; crop protection.

Rees SB;

New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents.

This polypeptide comprises a mutant isoform of radish antifungal protein 2 (Rs-AFP2) (see also AAW19616). Novel potent antifungal proteins (see AAW66311-90) are based on Rs-AFP2 and contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnSMet (see AAW26379), GlyBArg (AAW26380), GlyBArg (AAW26376), Val33Arg (AAW26377) or GlyBArg plus Val33Arg (AAW26377) or GlyBArg plus Val33Arg (AAW26379) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA mechads to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have ourative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative

```
Antimicrobial composition useful for treating microbial diseases in plants, comprises two antimicrobial agents, which are antifungal protein from Radish and Mirabilis of Impatiens.
                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is an antifungal protein from Radish. This protein is useful for treating microbial diseases in plants and for inhibiting microbial growth in foodstuffs. In addition, the present sequence is useful for producing plants with improved resistance to microbial pathogens. The present protein can be used in conjunction with other antimicrobial proteins from Mirabilis (see AAB49472), and ministrobial composition ministrobial composition from ministrobial composition and ministrobial composition.
                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 26; 29pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This protein sequence is the Raphanus sativus (radish) mature antifungal brotein (Rs-AFW), which is homologous to proteins AAM19280- AAM19290. Shorter peptides, based on these proteins have been produced (see AAM19291-92, AAM19291-98, AAM19301-304, AAM19330-34 and AAM1165-834). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease tolerance of crops, either pre or post harvest. When applied to plants may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of expressing the peptide into the soil. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                               Antifungal protein; candida; fungal resistance; food additive; radish; crop protection; plant defensin; bacterial protection; preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
This protein sequence is the Rhapanus sativus (radish) mature antifungal protein (Rs-AFP2), which is homologous to proteins AAM19280- AAM19290.

Shorter peptides, based on these proteins have been produced (see AAW19291-92, AAW19294-98, AAW1901-304, AAW1930-34 and AAW1765-834).

Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, they may also have curative as well as protective actions. The peptides to plants they may also have curative as well as protective actions. The peptides microorganism capable of expressing the peptide into the soil. (Updated on 25-WAR-2003 to correct PI field.)
      Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "Val at position 39 may be replaced by a basic amino acid, preferably Arg""
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Gly at position 9 may be replaced by a basic amino acid, preferably Arg""

This polypeptide comprises radish antifungal protein 2 (Rs-AFP2). Novel potent antifungal proteins (see AAW26371-90) based on Rs-AFP2 contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions, 5 or 16. Proteins containing Gln5Met (see AAW26379), Gly16Met (AAW26300), Gly2Arg (AAW26376), Val39Arg (AAW26377) or Gly9Arg plus Val39Arg (AAW26376) mutations are specifically claimed. A cDNA chone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combating tungal diseases in agricultural, pharmaceutical or preservative applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an antifungal peptide. The invention relates to an antifungal composition comprising one or more antifungal agents and one or more food additives, providing that the composition does not contain nicin or lactoferrin or a derivative, trichorziamine or lysozyme, the relative amounts of antifungal agent and food additive being such that they enhance the activity of the overall antifungal activity of the composition. Especially the antifungal agent is derived from a plant or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Food additive synergistically enhances activity of an antifungal agent especially for prevent food and beverage spoilage.
                                          New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a a plant defensin protein. Defensins have antimicrobial properties. The specification describes a modified Cyscontaining antimicrobial peptide derived from a plant defensin. The peptide is modified by introducing one or more Cys residues and/or form disulfide bridges. The antimicrobial peptide is useful in the treatment and prevention of microbial infections e.g. for combating fungal infection. It is useful for agricultural and pharmaceutical applications. It is also useful for agricultural and pharmaceutical fungal and is also useful in combating bacterial infections. A DNA sequence encoding the antimicrobial peptide is useful for producing transgenic plants with increased resistance to microbial pathogen, such that the plant is used as a parent in standard plant breeding crosses to develop hybrids and lines having improved fungal resistance
seed and the food additive is selected from an acid, salt or ester or a 1 dec alkyl ether or derivatives. The compositions are useful in preventing food spoilage e.g. in a wide range of foods and beverages including fruits, jams and dairy products, caused by the spoilage organisms fruits, jams and dairy products, caused by the spoilage organisms hastriam culmorum, Penicallium chrysogenum, P. roquefortli, P. nalgiovense, P. commune, Alternaria sp., Cladosporum sp., Tichoderma harzianum, Mucor plumbeus, Aspergillus versicolor and Scopulariopsis brevicaulis. The food additive and antifungal agent act synergistically to enhance the overall antifungal activity of the composition to a level above the sum of each single component
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial peptide for combating bacterial infections, comprises modified cysteine residues, modified by addition, substitution or deletion to block their ability to form disulfide bridges.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fant F;

Van Amerongen A,

Novel antimicrobial proteins derived from plant defensin useful against a broad spectrum of microbes, comprise substitutions at specified portions of its sequence.

Disclosure; Page 6; 64pp; English

The present sequence is that of radish defensin protein Rs-AFP2. A claimed antimicrobial protein or peptide is derived from a plant defensin characterised by having lor more replacement amino acids, as indicated at positions 32, 34, 35, 36, 37, 38, 39, 40, 41 and/or 42 of the Rs-AFP2 sequence, provided that the replacement amino acids are not found raturally at these positions and the protein does not comprise only a replacement arginine at position 37, 39 or 42. In addition, cysteine residues may be replaced by alpha-aminobutyric acid. The antimicrobial protein or peptide is preferably derived from Rs-AFP1 (see AAF2220), Rs-AFP1, Hs-AFP2, Bn-AFP2, Bn-AFP2, Bn-AFP2, Sa-AFP1, Sa-AFP4, Br-AFP9, Dn-AMP1. The antimicrobial protein or peptide can be used on its own, or in synergistic combination with a plant defensin, to combat fungi. A plant having improved resistance to a fungal or microbial pathogen can contain recombinant DNA which expresses a clanked antimicrobial protein or peptide. The claimed antimicrobial protein or peptide is also used as a pharmaceutical to treat or prevent a microbial infection, especially a fungal infection (all claimed)

                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 71,

| Sequence 20, Application US/09077951
| Patent No. 637288
| GENERAL INFORMATION:
| APPLICANT: De Samblanx, Genoveva
| APPLICANT: Rees, Sarah
| TITLE OF INVENTION: Antifungal Proteins
| FILE REFERENCE: PDP50093
| CURRENT APPLICATION NUMBER: US/09/077,951
| CURRENT APPLICATION NUMBER: GB 9525474.4
| EARLIER APPLICATION NUMBER: GB 9525474.4
| EARLIER PILING DATE: 1995-12-13
| EARLIER PILING DATE: 1995-12-13
| FARLIER PILING DATE: 1995-12-12
| NUMBER OF SEQ ID NOS: 77
| SOFTWARE: PatentIN Ver. 2.0
| SEQ ID NO 20
| LENGTH: 51
| TYPE: PRT
| GROANISM: Raphanus sativus

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sefels

defensin AMPI - Clitoria ternatea

NyAlternate names: seed antifungal protein

C;Species: Clitoria ternatea

R;Osborn, R.W.; de Samblanx, G.W.; Thevissen, K.; Goderis, I.; Torrekens, S.; van Leuven, R;Diation and characterisation of plant defensins from seeds of Asteraceae, Fabs A;Reference number: S66219

Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Possesses antifungal activity sensitive to inorganic
cations (By similarity).
-!- SUBCELLUMAR LOCATION: Secreted.
-!- SUBCELLUMAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PROSITE; PS00940; GAMMA_THIONIN; 1.

Nature 402:761-768(1999).
-!- FUNCTION: Possesses antifungal activity sensitive to inorganic cations (By similarity).
-!- SUBCELLULAR LOCATION: Secreted (By similarity).
-!- SIMILARITY: Belongs to the plant defensin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Cysteine-rich antifungal protein 2A (AFP2A) (MZA).
Sinapis alba (White mustard) (Brassica hirta). 

MEDLINE=96433791, PubMed=8836771; Neumann G.M., Condron R., Polya G.M.; "Purification and mass spectrometry-based sequencing of yellow mustard (Sinapis alba L.) 6 kDa proteins. Identification as TISSUE=Seed; SEQUENCE

Terras F.R.G., Torrekens S., van Leuven F., Osborn R.W., Vanderleyden J., Cammue B.P.A., Broekaert W.F., Brannily of basic cysteine-rich plant antifungal proteins from Brassicaceae species."; FEBS Lett. 316:233-240(1993). Int. J. Pept. Protein Res. 47:437-446(1996). MEDLINE=93138130; PubMed=8422949; antifungal proteins."; SEQUENCE OF 1-26.

-!- FUNCTION: Possesses antifungal activity sensitive to inorganic cations.
-!- SUBDNIT: Forms oligomers in its native state.
-!- MASS SPECTROMETRY: WW=5705; MW ERR=0.8; METHOD=Electrospray.
-!- SIMILARITY: Belongs to the plant defensin family. HSSP, P30231; 1AYJ. InterPro; IPR008176; Gamma-thionin. InterPro; IPR003614; Knot1. Pfam; PF00304; Gamma-thionin; 1. ProDom; PD002594; G\_Purothionin; 1.

C -!- FUNCTION: Anther-specific cell wall protein which could contribute control and larchitecture of epidermal anther cells via intermolecular disulfide bridges.

C -:- TISSUE SPECIFICITY: Epidermal anther cells.

CC -:- DEVELOPMENTAL STAGE: Late developmental stages.

CC -:- SIMILARITY: Belongs to the plant defensin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. "A new family of basic cysteine-rich plant antifungal proteins from
Brassicacae species.";

"EBS Lett. 316;233-240(1993).

-!- FUNCTION: Possesses some antifungal activity sensitive to
inorganic cations and antibacterial activity against B.megaterium.

-!- FUNCTION: Possesses some antifungal activity against B.megaterium.

-!- SIMILARITY: Belongs to the plant defensin family.
